iOS

PLAN

Control budgets with data-based planning

You can't afford to discover surprise expenses during software rollouts: target computers that don't meet the application's hardware requirements, don't have the prior version already installed (for upgrades), or require an OS update before installing.

At best, these things will delay the rollout. At worst, they will result in "shelfware," because your budget simply can't cover the unplanned expenses.

Reduce those risks with the detailed inventory reporting in FileWave. Easy-to-use filters allow you to plan for hardware or OS upgrades before you even purchase the software. Fully informed planning optimizes your spending and your staff's time.

ROLLOUT

Software distribution that's efficient and effective

For simple rollouts, FileWave supports standard software packages, such as Windows MSI or Apple PKG files. To take full advantage of FileWave's patented File-level Distribution, Fileset Magic lets you easily create your own packages, reducing the need to rely on end-user interactions to install.

FileWave Booster technology and checkpoint restart combine to ensure that applications are installed even on highly distributed networks, or unreliable connections.

MAINTAIN

Keep applications running where they belong

Whether it's inadvertent or malicious, applications are sometimes removed or altered on devices. FileWave's patented Self-healing reduces help desk calls and keeps mission-critical applications in place by automatically repairing corrupted files, or reinstalling missing software.

Finally, administrators can protect systems from security exploits through Patch Management of both operating systems and applications.

Highlighted Features

FILEWAVE INVENTORY

Hundreds of data points gathered on applications, devices, and users.

FILESET MAGIC

Software repackaging with FileWave's patented Fileset technology.

FILEWAVE BOOSTER

Makes software deployments faster and more reliable on highly distributed networks.

FILEWAVE SELF-HEALING

Automatically detects missing or corrupted applications, then repairs or reinstalls them.

PATCH MANAGEMENT

Apply OS and third party application patches automatically.
